

CLOUD COMPUTING LAB

ASSIGNMENT 4:

OPENSTACK CLOUD INSTALLATION AND VIRTUAL MACHINE SETUP

NAME : SWAPNADEEP MISHRA

ROLL NO : 002211001115

GROUP MEMBER:

**SAMUDRA ROY
(002211001114)**

SECTION NO : A3

OpenStack Cloud Installation and Virtual Machine Setup Report

Objective:

The objective of this assignment is to familiarize students with the installation and configuration of OpenStack, a cloud computing platform, and to create and manage Virtual Machines (VMs) using OpenStack.

Task Overview:

Install OpenStack using DevStack or PackStack on a local or virtual environment.

Set up a basic cloud infrastructure, including network configurations.

Create and manage at least two Virtual Machines (VMs) on the OpenStack cloud.

Demonstrate the functionality of the OpenStack cloud, including launching, pausing, and deleting VMs.

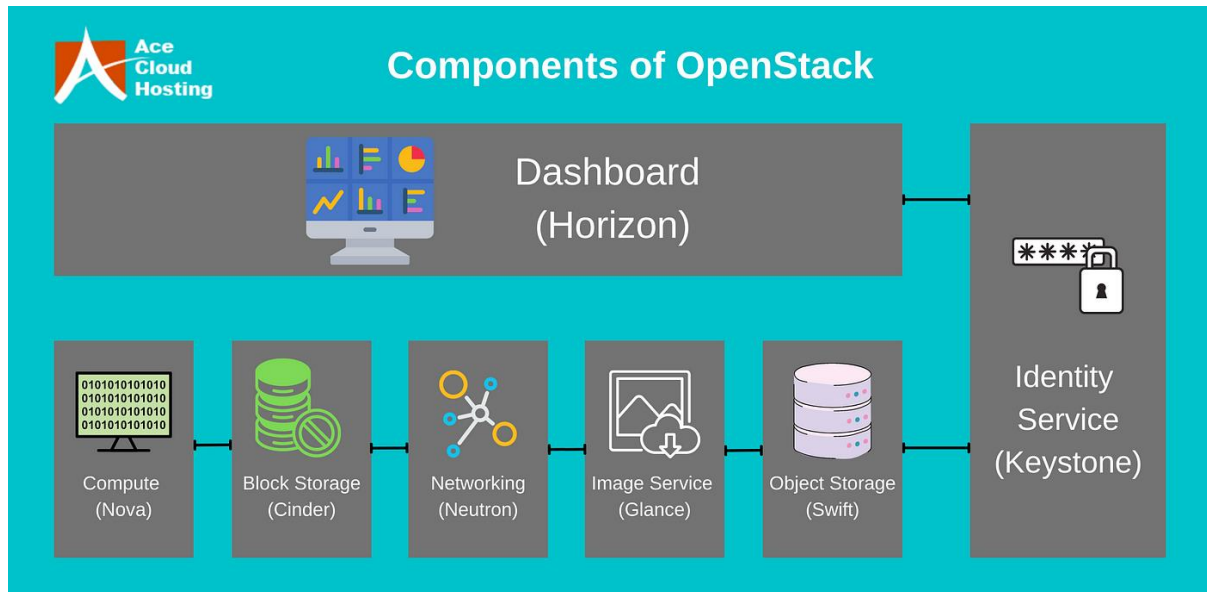

Submit a report documenting the process, challenges faced, and solutions implemented.

Introduction

OpenStack is a popular open-source cloud computing platform that allows users to create and manage cloud infrastructures. The platform consists of a number of components, including:

- **Keystone:** OpenStack's identity service for authentication.
- **Nova:** The compute service responsible for managing virtual machines (VMs).
- **Neutron:** The network service that handles networking for OpenStack.
- **Glance:** The image service that provides discovery, registration, and delivery services for disk and server images.
- **Horizon:** A web-based user interface for managing OpenStack services and components.

In this assignment, the goal is to install OpenStack, set up a basic cloud infrastructure, and create virtual machines (VMs).

Part 1: OpenStack Installation:

Installation Process

Step 1: Choose Installation Method

We chose **DevStack**, which is designed for a lightweight and development-friendly OpenStack installation. DevStack is often used for testing and development environments, making it the ideal choice for this assignment.

DevStack

DevStack is a series of extensible scripts used to quickly bring up a complete OpenStack environment based on the latest versions of everything from git master. It is used interactively as a development environment and as the basis for much of the OpenStack project's functional testing.

The source is available at <https://opendev.org/openstack/devstack>.

Warning

DevStack will make substantial changes to your system during installation. Only run DevStack on servers or virtual machines that are dedicated to this purpose.

Quick Start

Install Linux

Start with a clean and minimal install of a Linux system. DevStack attempts to support the two latest LTS releases of Ubuntu, Rocky Linux 9 and openEuler.

If you do not have a preference, Ubuntu 22.04 (Jammy) is the most tested, and will probably go the smoothest.

Add Stack User (optional)

DevStack should be run as a non-root user with sudo enabled (standard logins to cloud images such as "ubuntu" or "cloud-user" are usually fine).

If you are not using a cloud image, you can create a separate `stack` user to run DevStack with

Step 2: Install Required Dependencies

We followed the DevStack installation guide to ensure all necessary dependencies were installed.

1. Install system packages and libraries needed for the installation.

```
deep@deep-VirtualBox:~$ sudo chmod +x /opt/stack
deep@deep-VirtualBox:~$ echo "stack ALL=(ALL) NOPASSWD: ALL" | sudo tee /etc/sudoers.d/stack
stack ALL=(ALL) NOPASSWD: ALL

deep@deep-VirtualBox:~$ sudo -u stack -i
stack@deep-VirtualBox:~$ git clone https://opendev.org/openstack/devstack
Command 'git' not found, but can be installed with:
sudo apt install git
stack@deep-VirtualBox:~$ sudo apt install git
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following additional packages will be installed:
  git-man liberror-perl
Suggested packages:
  git-daemon-run | git-daemon-sysvinit git-doc git-email git-gui gitk gitweb git-cvs git-mediawiki git-svn
The following NEW packages will be installed:
  git git-man liberror-perl
0 upgraded, 3 newly installed, 0 to remove and 2 not upgraded.
Need to get 4,146 kB of archives.
After this operation, 21.0 MB of additional disk space will be used.
Do you want to continue? [Y/n] y

```

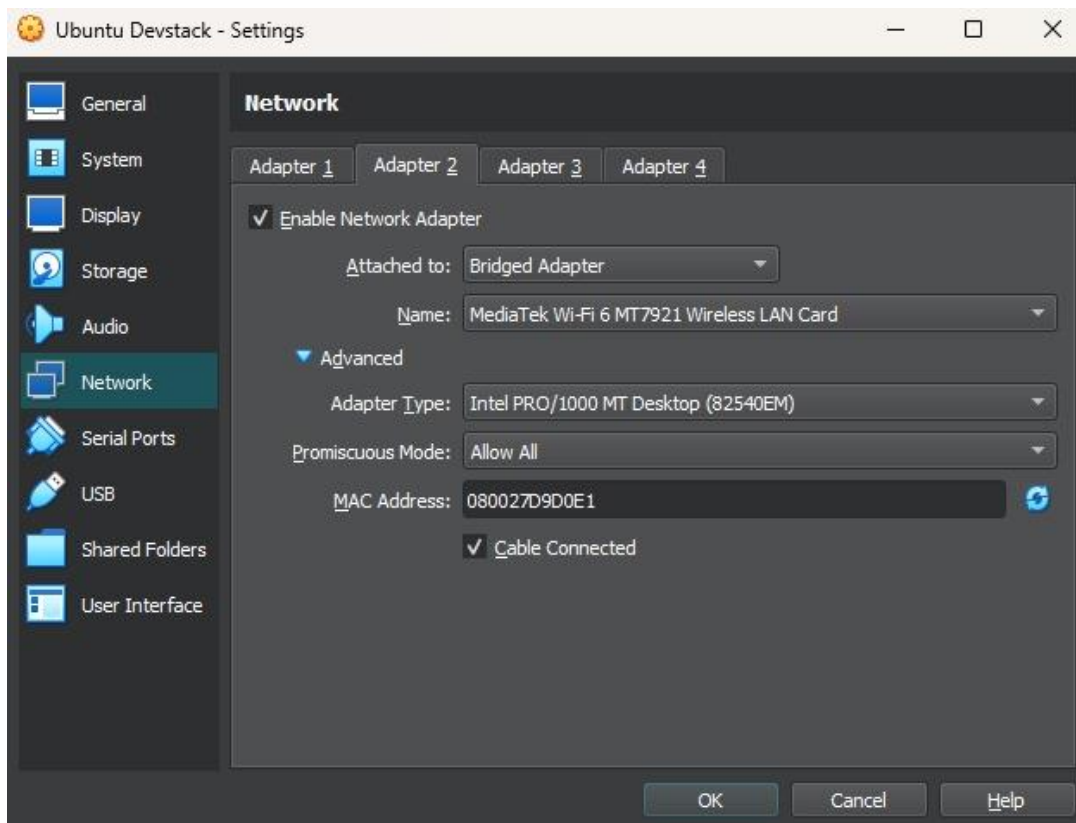

2. Clone the DevStack repository:

```
stack@deep-VirtualBox:~$ git clone https://opendev.org/openstack/devstack
Cloning into 'devstack'...
remote: Enumerating objects: 51071, done.
remote: Counting objects: 100% (31062/31062), done.
remote: Compressing objects: 100% (10437/10437), done.
remote: Total 51071 (delta 30307), reused 20625 (delta 20625), pack-reused 20009
Receiving objects: 100% (51071/51071), 9.58 MiB | 3.15 MiB/s, done.
Resolving deltas: 100% (36266/36266), done.
stack@deep-VirtualBox:~$ cd devstack
stack@deep-VirtualBox:~/devstack$
```

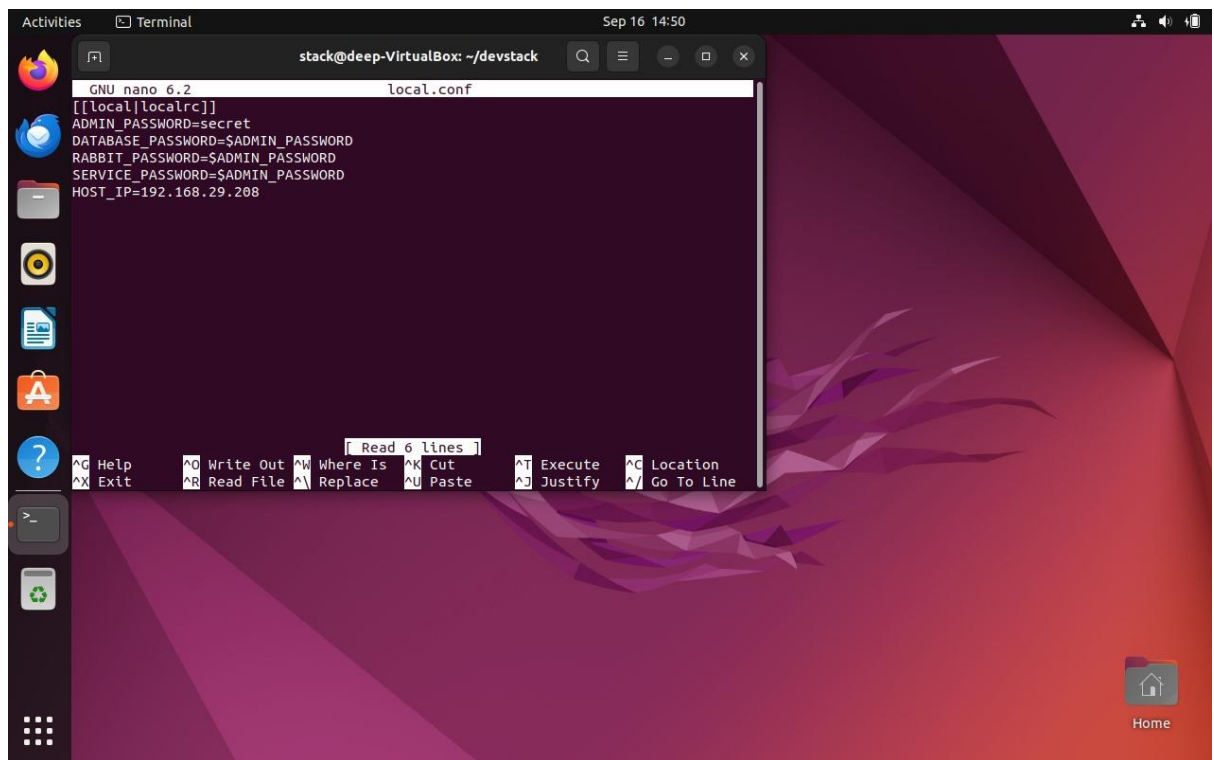

Step 3: Perform Installation on Ubuntu

Initially, I attempted to install DevStack on **Ubuntu 24 LTS**, but encountered errors during the process. After troubleshooting, I switched to **Ubuntu 22.04 LTS (Jellyfish)**, which resolved the installation issues.

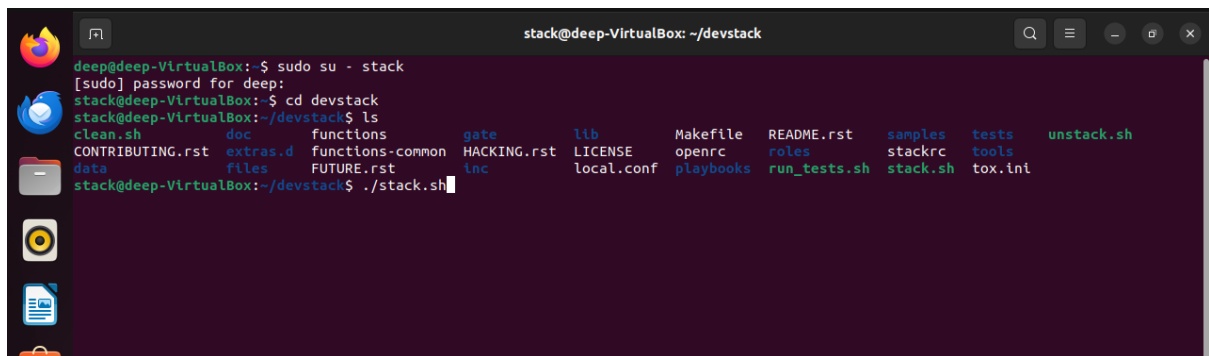

- Configuration of the ubuntu network access and IP setting:

- Created a local.conf file with the following content:

- Ran the installation script:

This successfully installed DevStack and set up the necessary OpenStack components which took around 30-40 minutes of time.

```
This is your host IPv6 address: 2405:201:8026:2191:836e:3d27:f65e:5f66
Horizon is now available at http://192.168.29.208/dashboard
Keystone is serving at http://192.168.29.208/identity/
The default users are: admin and demo
The password: secret

WARNING:

Configuring uWSGI with a WSGI file is deprecated, use module paths instead
Configuring uWSGI with a WSGI file is deprecated, use module paths instead
Configuring uWSGI with a WSGI file is deprecated, use module paths instead

Services are running under systemd unit files.
For more information see:
https://docs.openstack.org/devstack/latest/systemd.html

DevStack Version: 2024.2
Change: 0ff627286297a3957143577412884dc50ff8a57a Run chown for egg-info only if
the directory exists 2024-09-03 08:14:00 +0000
OS Version: Ubuntu 22.04 jammy

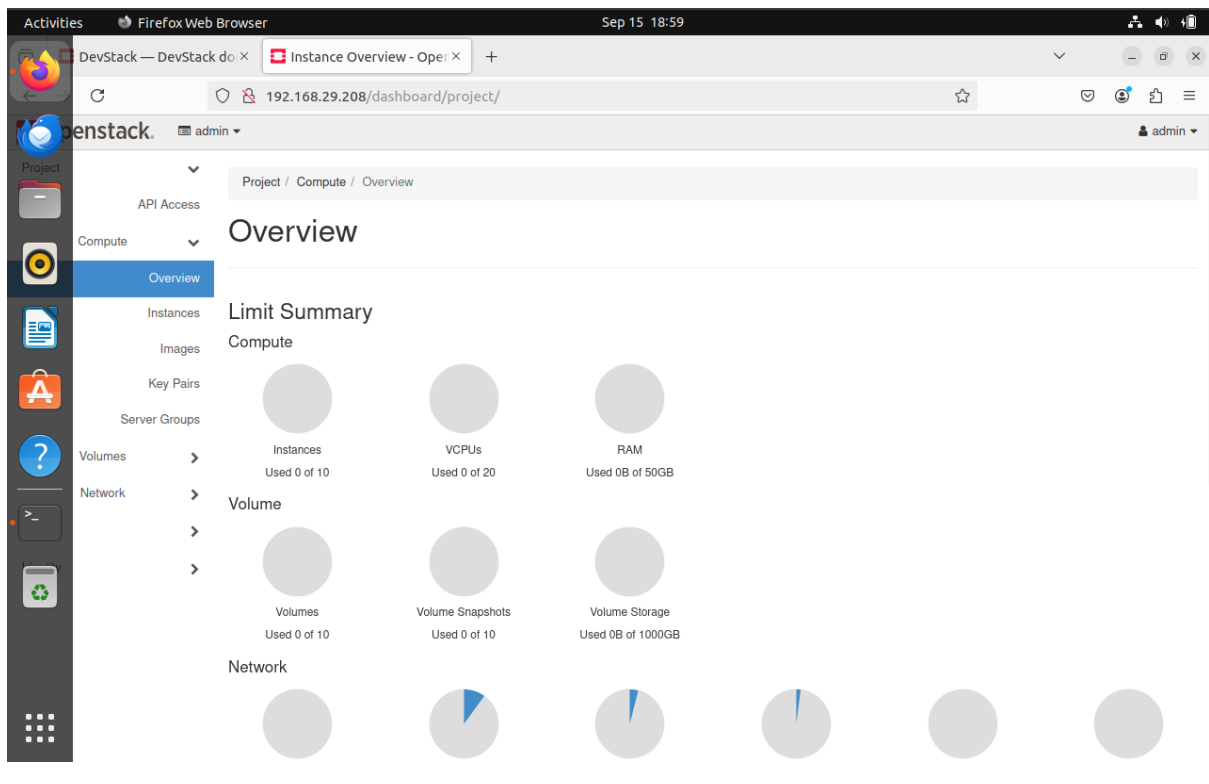

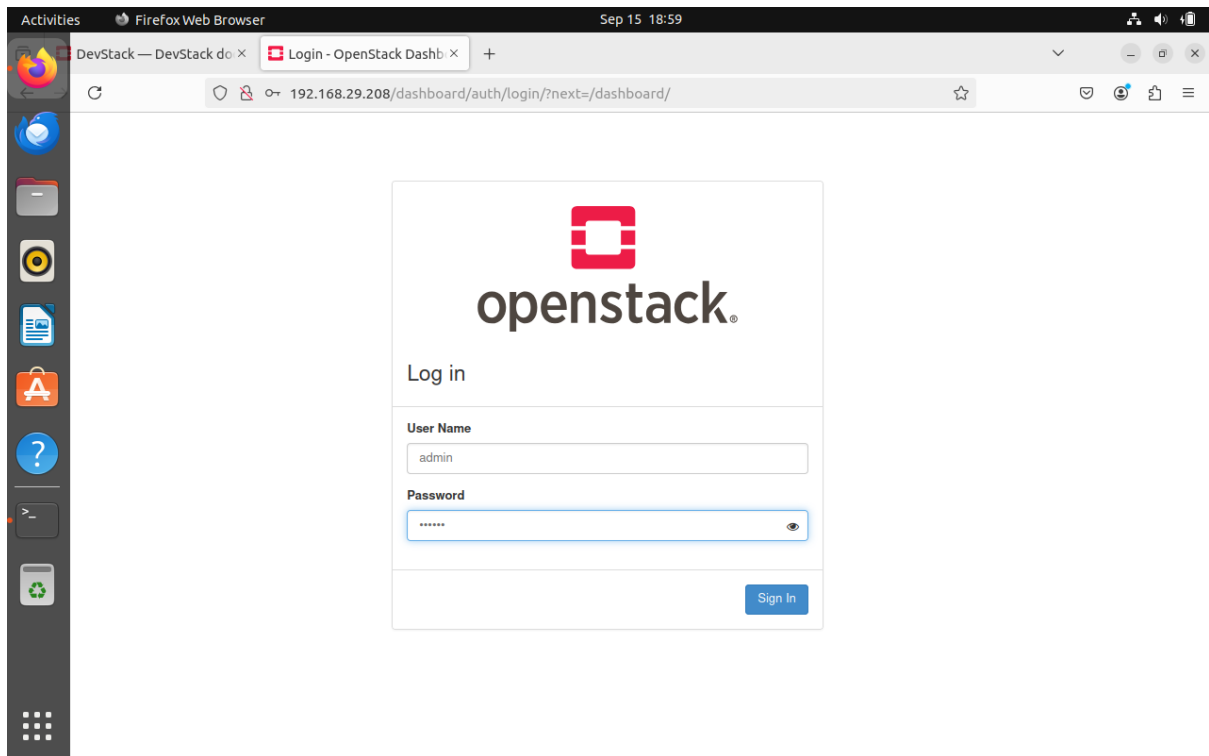

2024-09-15 13:14:17.084 | stack.sh completed in 3585 seconds.
```

Step 4: Configure OpenStack Components

The key components configured during installation were:

- **Keystone:** Provides identity services for users and projects.
- **Nova:** Handles the management of compute instances.
- **Neutron:** Manages networking between the instances.
- **Glance:** Stores and retrieves VM images.

-
- Horizon Dashboard of Openstack :

Challenges & Solutions

Challenge 1: Installation Errors on Ubuntu 24 LTS

During the installation process on **Ubuntu 24 LTS**, I encountered multiple dependency errors that prevented successful installation. After some research, I found that these issues were due to compatibility problems with DevStack on the latest version of Ubuntu.

```
stack@ubuntu: ~/devstack
ttp_proxy= https_proxy= no_proxy= apt-get --option Dpkg::Options::=--force-confo
ld --assume-yes install qemu-system libvirt-clients libvirt-daemon-system libvir
t-dev python3-libvirt systemd-coredump
E: dpkg was interrupted, you must manually run 'sudo dpkg --configure -a' to cor
rect the problem.
+functions-common:apt_get:1
+./stack.sh:exit_trap:540
++./stack.sh:exit_trap:541
+./stack.sh:exit_trap:541
+./stack.sh:exit_trap:544
+./stack.sh:exit_trap:550
+./stack.sh:exit_trap:555
+./stack.sh:kill_spinner:450
+./stack.sh:exit_trap:557
+./stack.sh:exit_trap:558
Error on exit
+./stack.sh:exit_trap:560
+./stack.sh:exit_trap:561
+./stack.sh:exit_trap:563
+./stack.sh:exit_trap:566

+./stack.sh:exit_trap:575
exit 100
stack@ubuntu:~/devstack$
```

```
/stack/devstack/tools/worldddump.py -d /opt/stack/logs
World dumping... see /opt/stack/logs/worldddump-2024-09-12-071351.txt for details
+./stack.sh:exit_trap:575
exit 100
stack@ubuntu:~/devstack$ sudo dpkg --configure -a
dpkg: error: failed to write status database stanza about 'sssd-common' to '/var
/lib/dpkg/status': No space left on device
stack@ubuntu:~/devstack$
```

Solution: I switched to **Ubuntu 22.04 LTS (Jellyfish)**, which is more stable and compatible with DevStack. This resolved the installation errors, and the process proceeded smoothly afterward.

```
DevStack Version: 2024.2
Change: 0ff627286297a3957143577412884dc50ff8a57a Run chown for egg-info only if
the directory exists 2024-09-03 08:14:00 +0000
OS Version: Ubuntu 22.04 jammy
2024-09-15 13:14:17.084 | stack.sh completed in 3585 seconds.
```

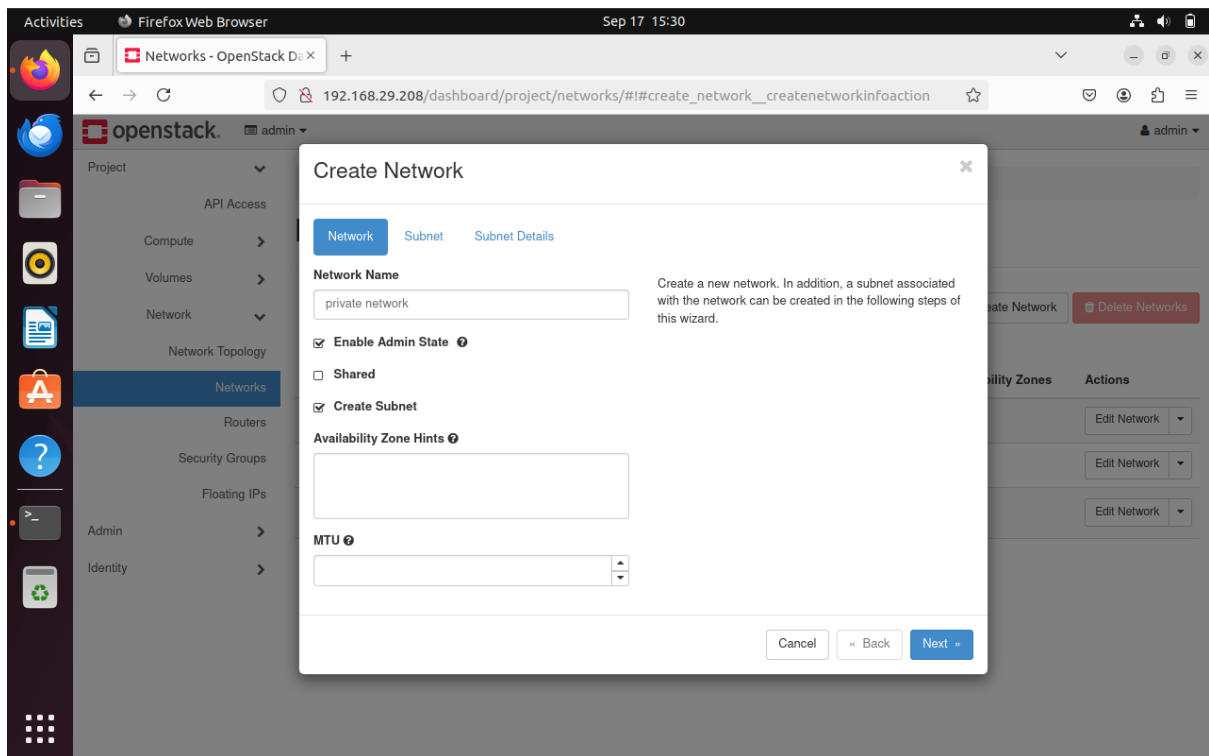

Part 2: Cloud Infrastructure Setup

VM Setup:

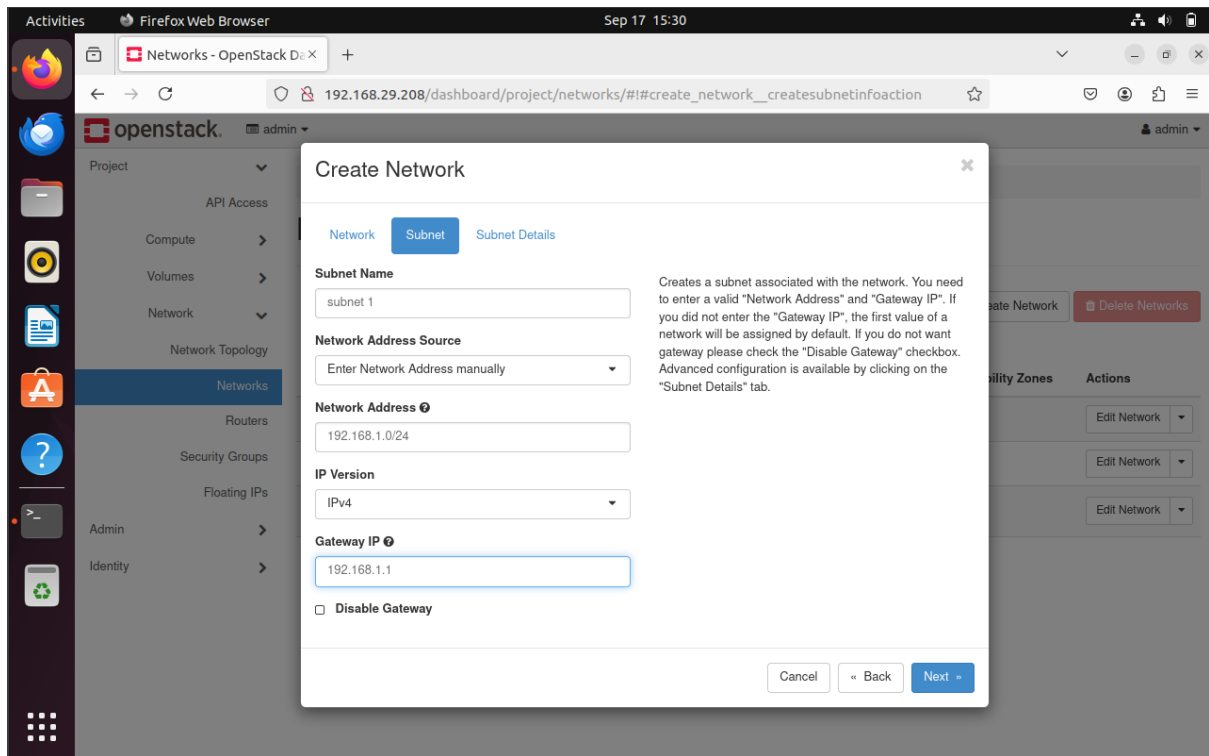

Step 1: Network Configurations

Private Network Setup

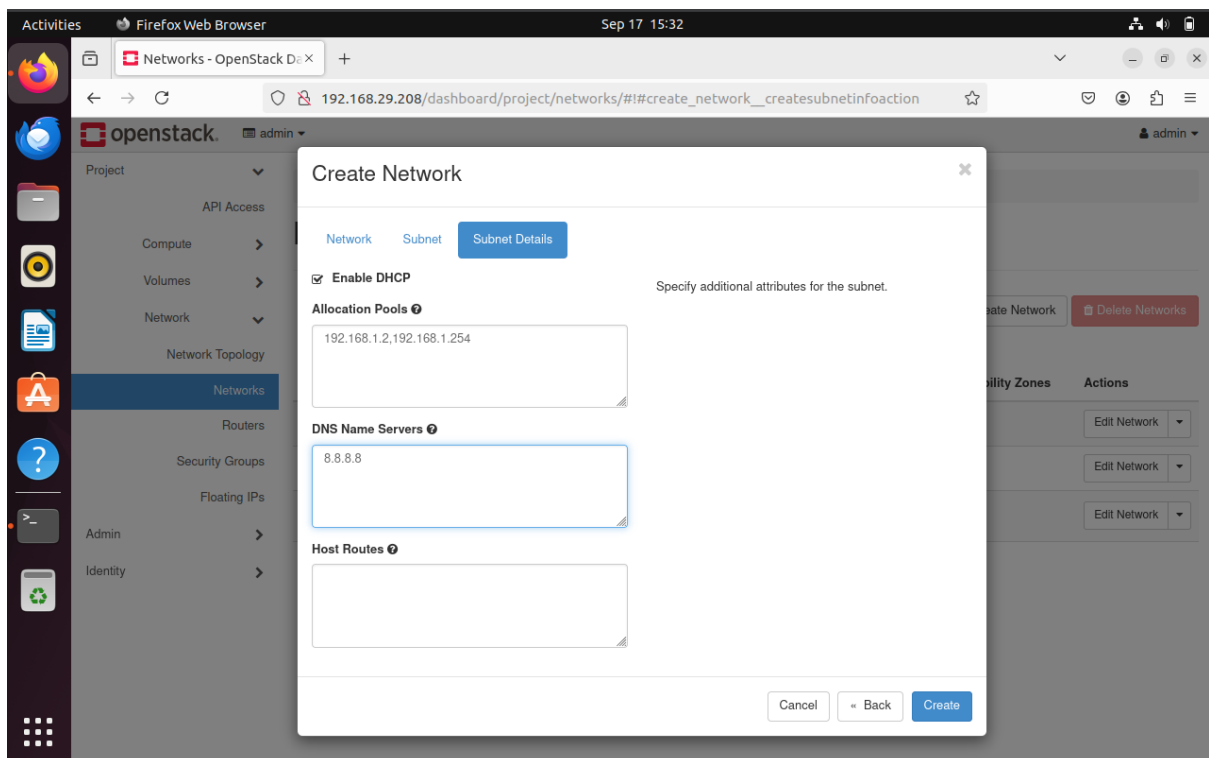

1. **Create a private network** for internal communication between virtual machines:
 - Navigate to the **Horizon Dashboard**.
 - Go to **Project > Network > Networks** and click **Create Network**.
 - Specify the name as `Private-Network`.
 - Set a subnet range (e.g., `192.168.1.0/24`) and configure the DHCP server.

2. **Subnet Creation:**
 - Create a subnet for `Private-Network` with the range `192.168.1.2, 192.168.254`.

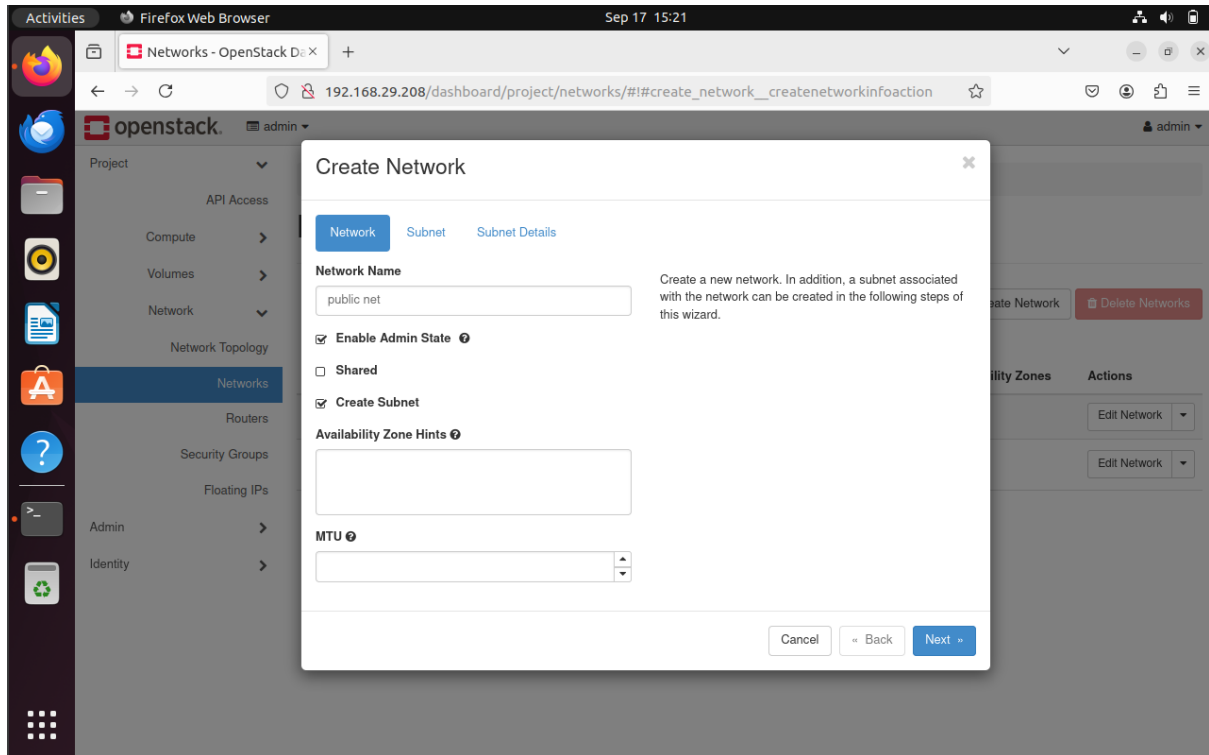

- Set up DHCP to assign IP addresses to VMs automatically.

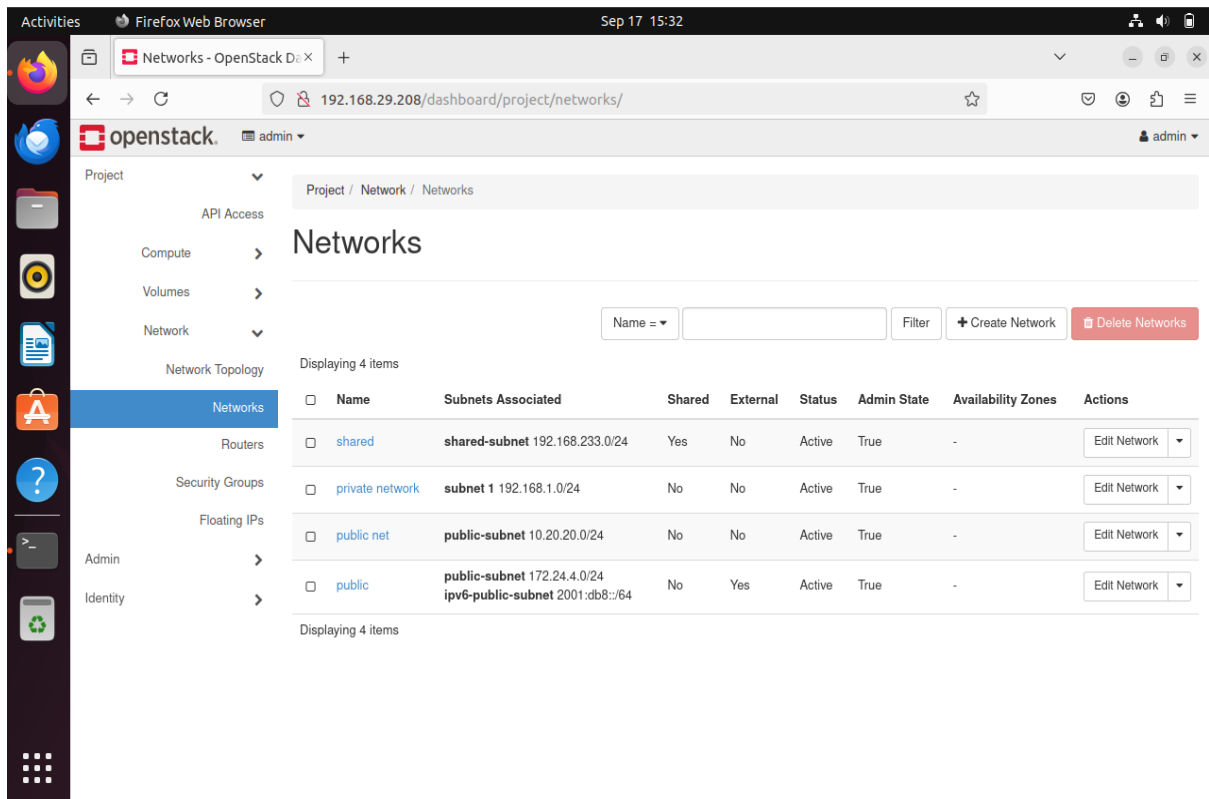

Public Network Setup

1. **Create a public network** to allow external access to virtual machines:
 - In the **Horizon Dashboard**, go to **Project > Network > Networks** and click **Create Network**.
 - Name it `Public-Net` and choose a valid IP range (e.g., `10.20.20.0/24`).

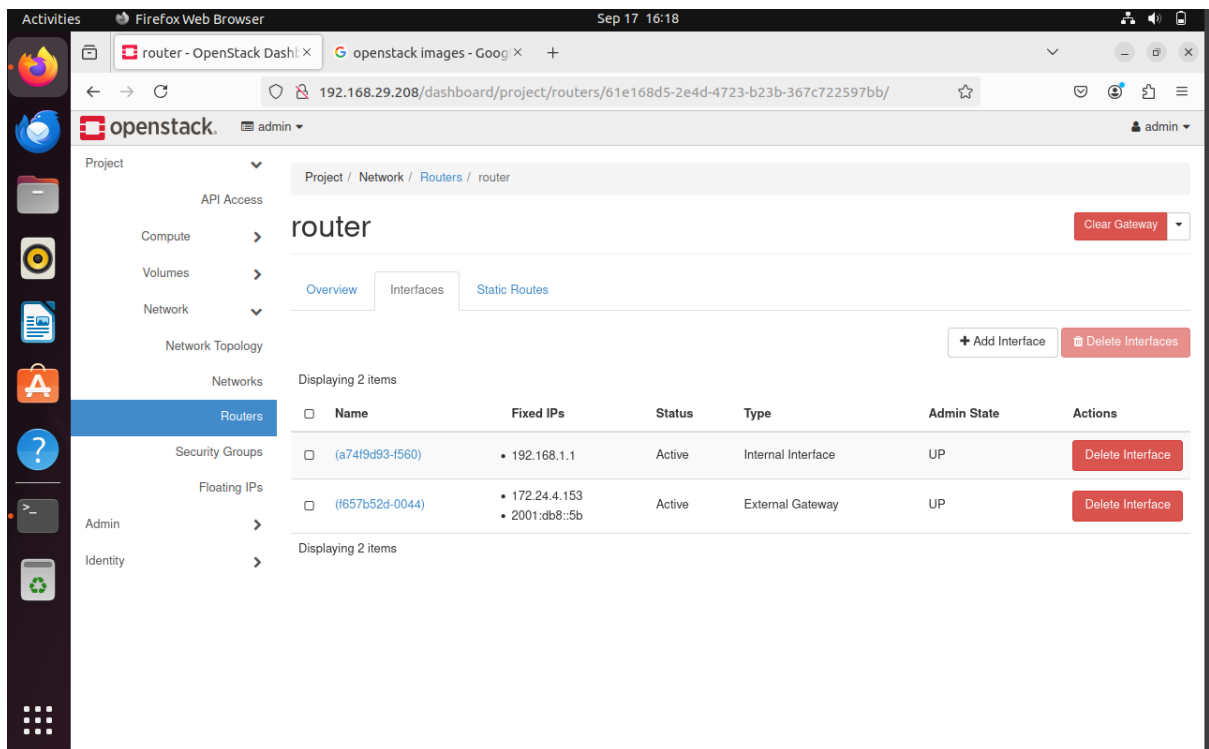

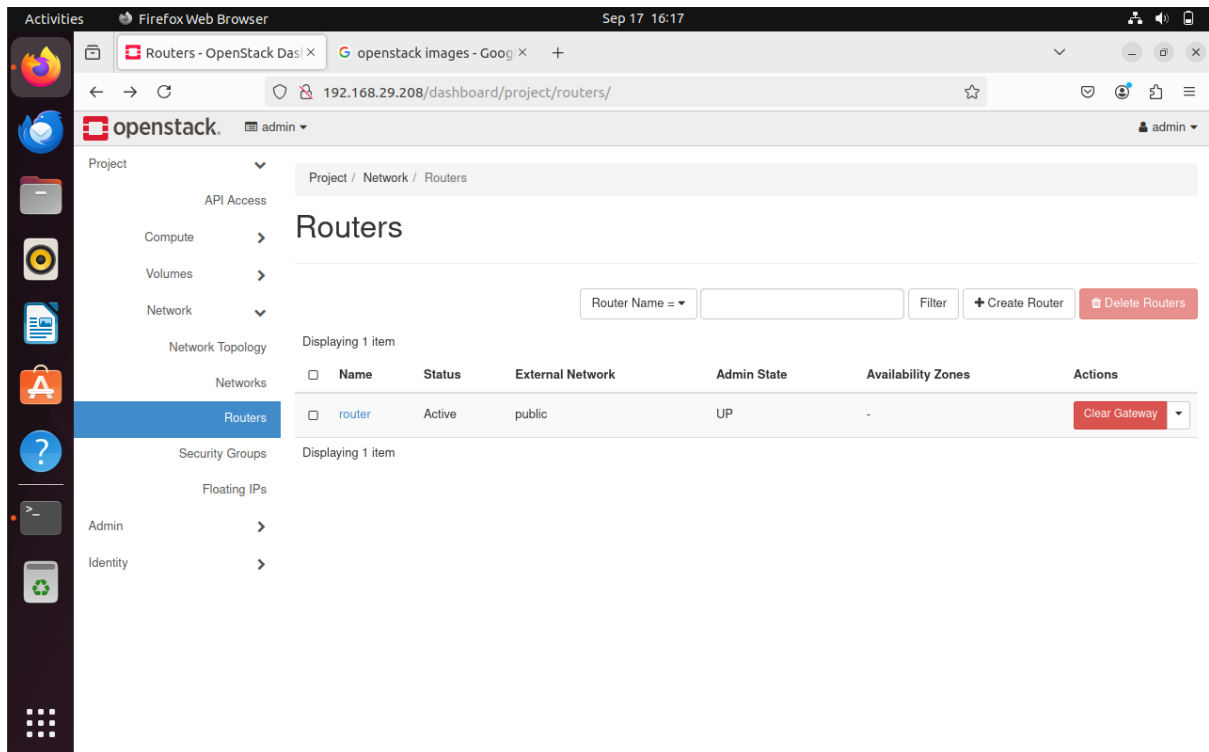

2. **Subnet for Public Network:**
 - Create a subnet for `Public-Network` with a valid external IP range.
 - Disable DHCP for this network since IPs will be manually assigned.

Created Networks:

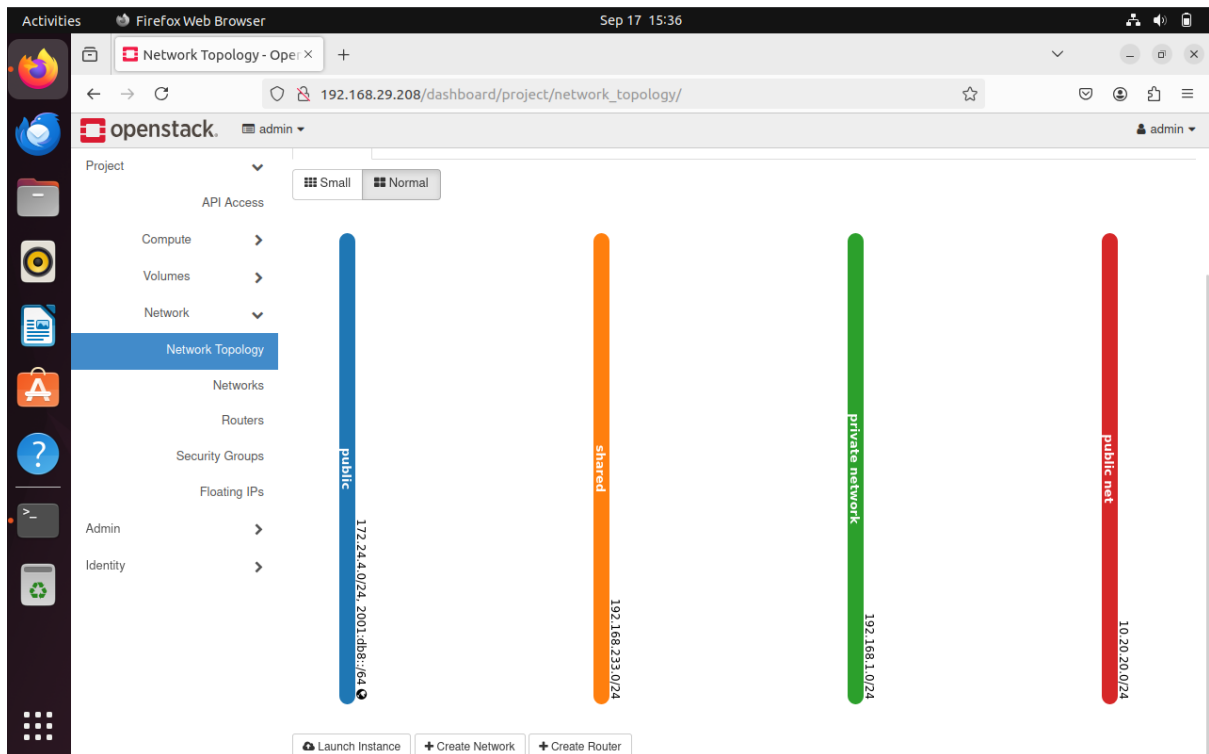

Configure Routers

1. Go to **Project > Network > Routers** and create a router.
2. Connect the router to both **Private-Network** and **Public-Network** to enable external access for VMs.

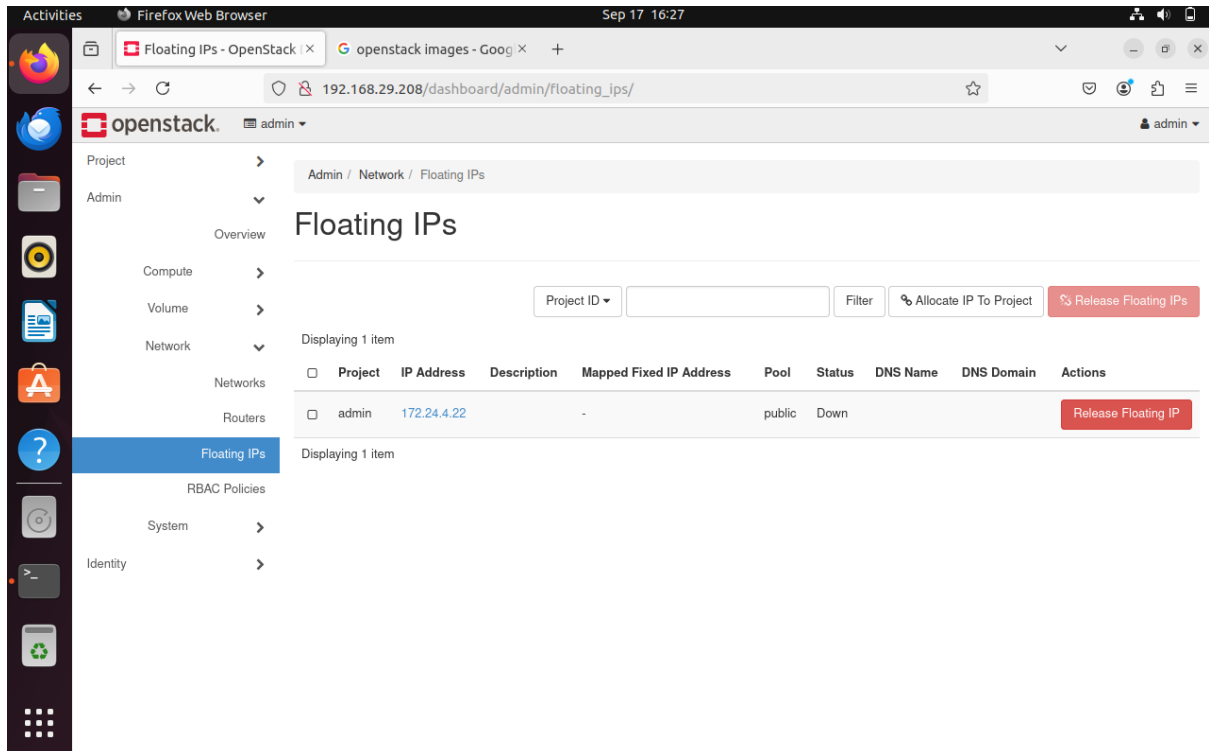

Network Topology:

Floating IPs

1. **Allocate floating IPs** to allow VMs on the private network to communicate externally.
 - o Navigate to **Project > Network > Floating IPs** and click **Allocate IP to Project**.

- Associate the floating IP with the external **Public-Network test**.

The screenshot shows the OpenStack dashboard interface. The left sidebar contains navigation links for Project, API Access, Compute, Overview, Instances (selected), Images, Key Pairs, Server Groups, Volumes, Network, Admin, and Identity. The main content area displays the 'Instances' page with a table of instances. One instance, 'test', is listed with IP address 192.168.1.61 and status 'Active'. The 'Actions' dropdown menu is open, showing options like 'Associate Floating IP', 'Attach Interface', 'Detach Interface', 'Edit Instance', 'Attach Volume', 'Detach Volume', 'Update Metadata', 'Edit Security Groups', 'Edit Port Security Groups', 'Console', 'View Log', 'Rescue Instance', 'Pause Instance', and 'Suspend Instance'.

2. Once the IP is allocated, assign it to a specific VM through the VM's **Actions > Associate Floating IP**.

The screenshot shows the OpenStack dashboard interface. The left sidebar contains navigation links for Project, API Access, Compute, Overview, Instances (selected), Images, Key Pairs, Server Groups, Volumes, Network, Admin, and Identity. The main content area displays the 'Instances' page with a table of instances. One instance, 'test', is listed with IP address 192.168.1.61 and status 'Active'. The 'Actions' dropdown menu is open, showing options like 'Associate Floating IP', 'Attach Interface', 'Detach Interface', 'Edit Instance', 'Attach Volume', 'Detach Volume', 'Update Metadata', 'Edit Security Groups', 'Edit Port Security Groups', 'Console', 'View Log', 'Rescue Instance', 'Pause Instance', and 'Suspend Instance'.

Displaying 1 item

Step 2: Security Groups

1. Default Security Group Configuration:

- By default, security groups block all traffic. To enable SSH and ICMP, modify the default security group.
- Go to **Project > Network > Security Groups** and click on the default security group.

2. Create Security Rules:

- **Add SSH Rule:** Enable SSH by adding a rule to allow incoming TCP traffic on IP address 172.24.4.187 from any source.
- **Allow Ping (ICMP):** Add a rule to allow all ICMP traffic to enable ping to VMs.

```
Microsoft Windows [Version 10.0.22631.4169]

    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),

C:\Users\SWAPNADEEP MISHRA>
```

Step 3: Add an Image Using Glance

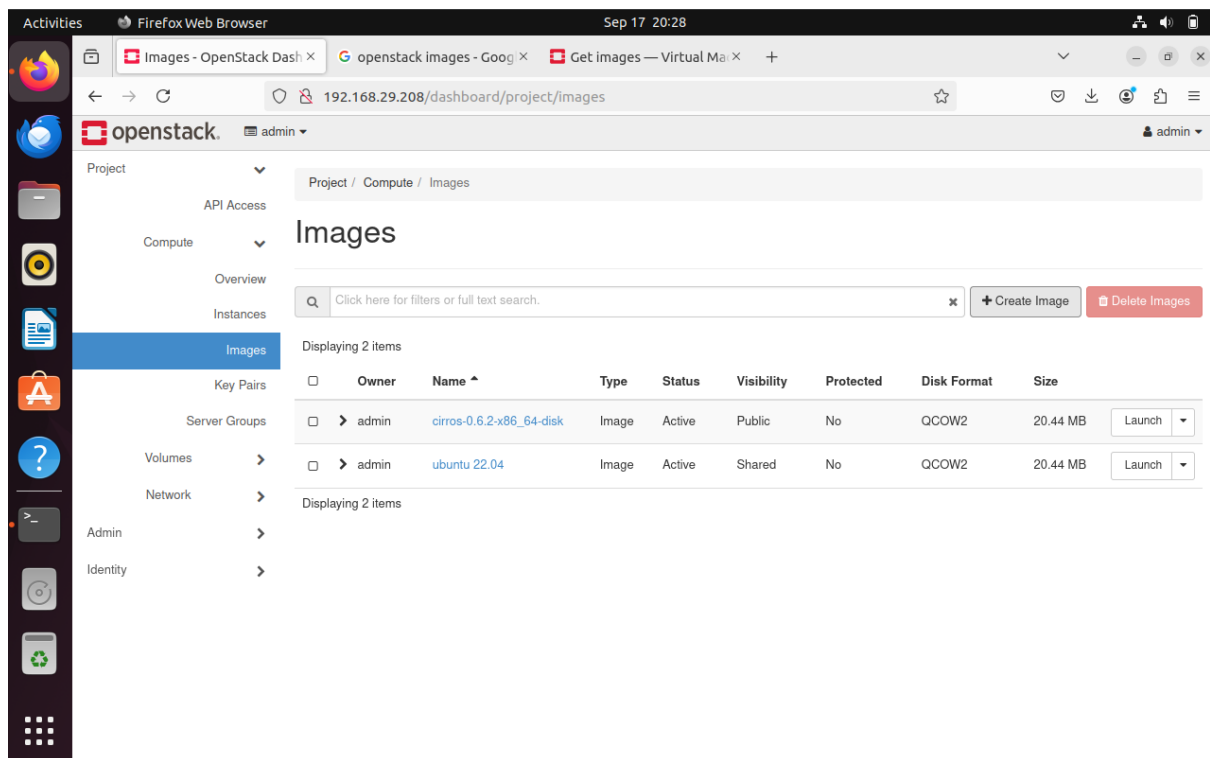

1. Upload OS Image:

- Go to **Project > Compute > Images** and click **Create Image**.
- Name the image `Ubuntu 22.04`.
- Choose the image source file (download from Ubuntu official sources).
- Set the disk format to `qcow2` (for efficient image storage) and the minimum disk size as 20.44MB.

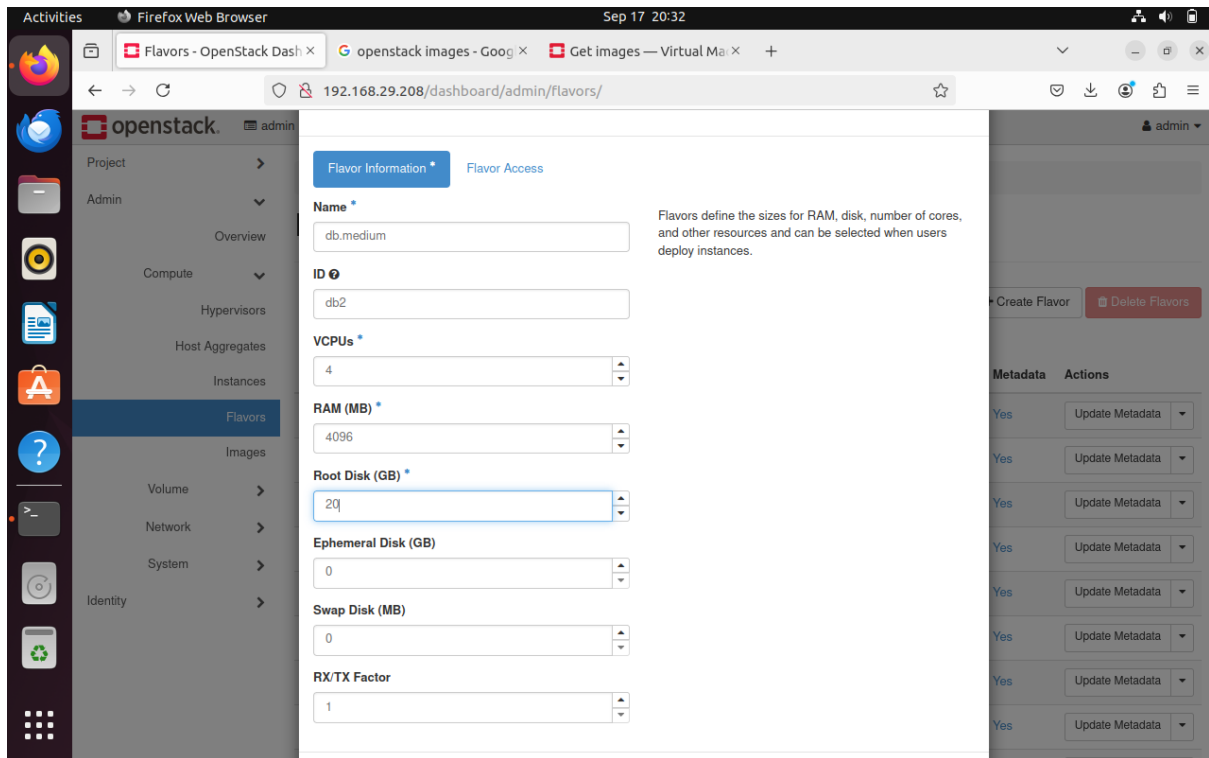

2. Verify the Image:

- After uploading, ensure the image is available under **Images** and is in an active state.

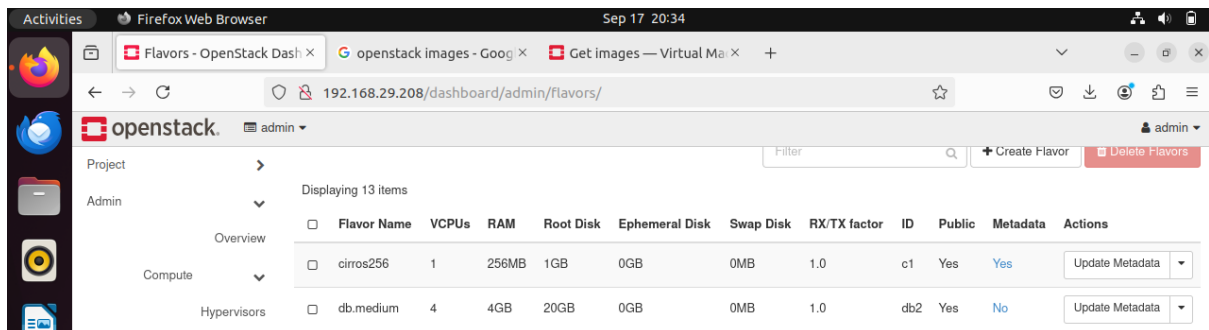

Step 4: Create a Flavor

1. **Define Compute, Storage, and Memory Resources:**
 - Go to **Admin > Compute > Flavors** and click **Create Flavor**.
 - Set the flavor name as `db.medium`.

2. Configure the Resources:

- Set **vCPUs** to 4, **RAM** to 4096MB (4GB), and **disk space** to 20GB.
- Save the flavor and ensure it is available for selection when launching VMs.

Challenges & Solutions

Challenge 1: Image Upload

- Initially, I encountered an issue where the uploaded image failed to reach an active state due to a misconfiguration in the Glance service.
- **Solution:** I corrected the disk format setting to `qcow2` and ensured that the image size was compatible with the available storage. This resolved the issue, and the image was successfully activated.

Challenge 2: Floating IP Assignment

- The floating IPs were not being properly associated with VMs, leading to failed external connections.
- **Solution:** After verifying the router setup and network configurations, I identified that the router was not properly linked to the external network. Reconfiguring the router resolved the floating IP issue, and the VMs were able to connect to external networks.

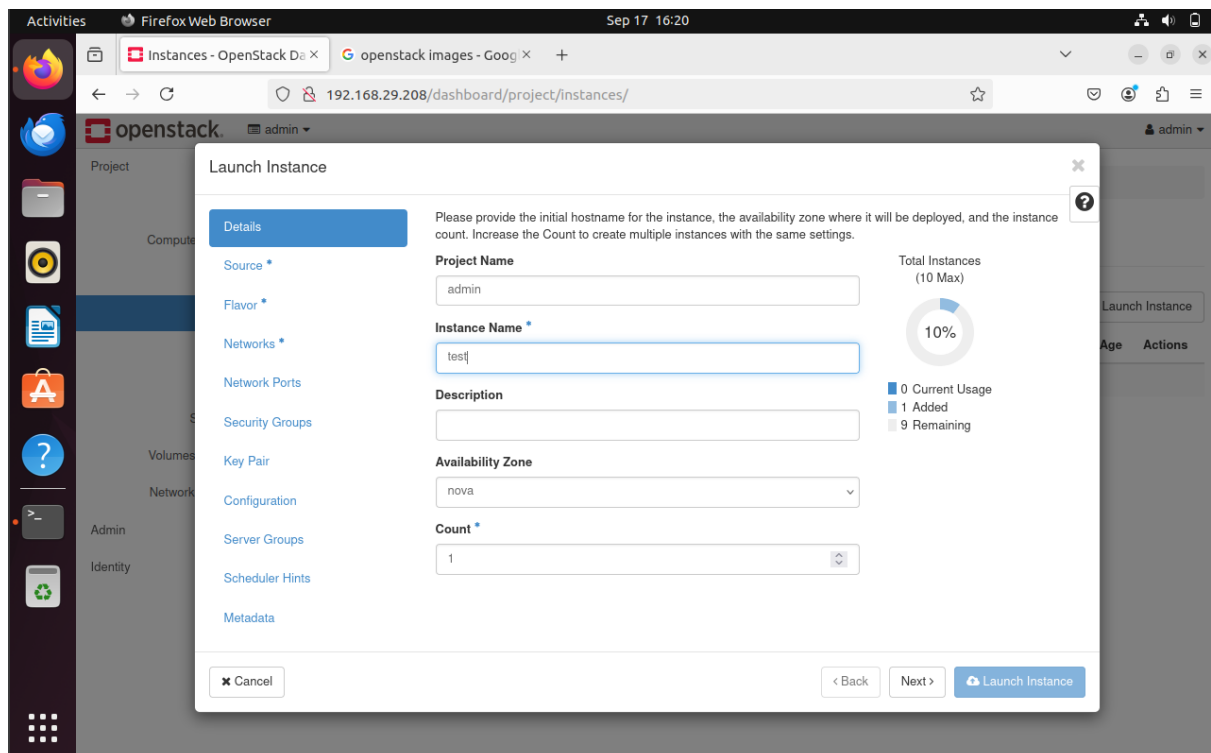

Part 3: Virtual Machine Creation and Management Report

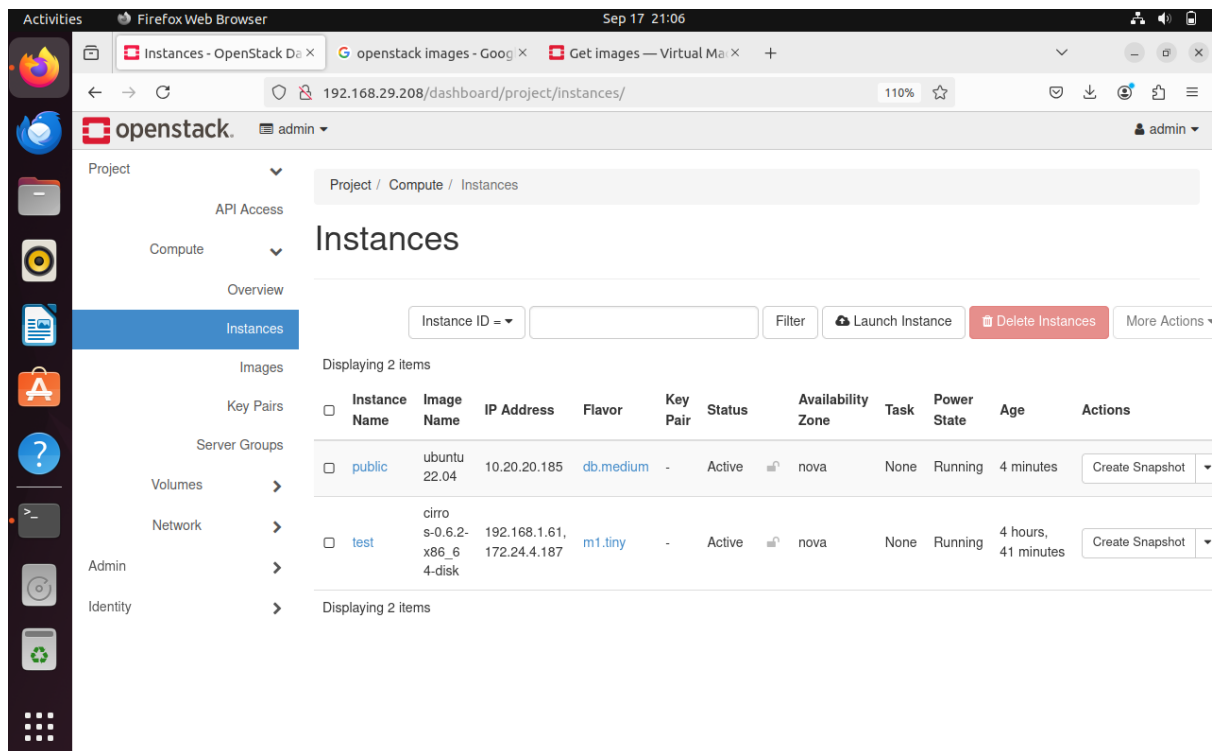

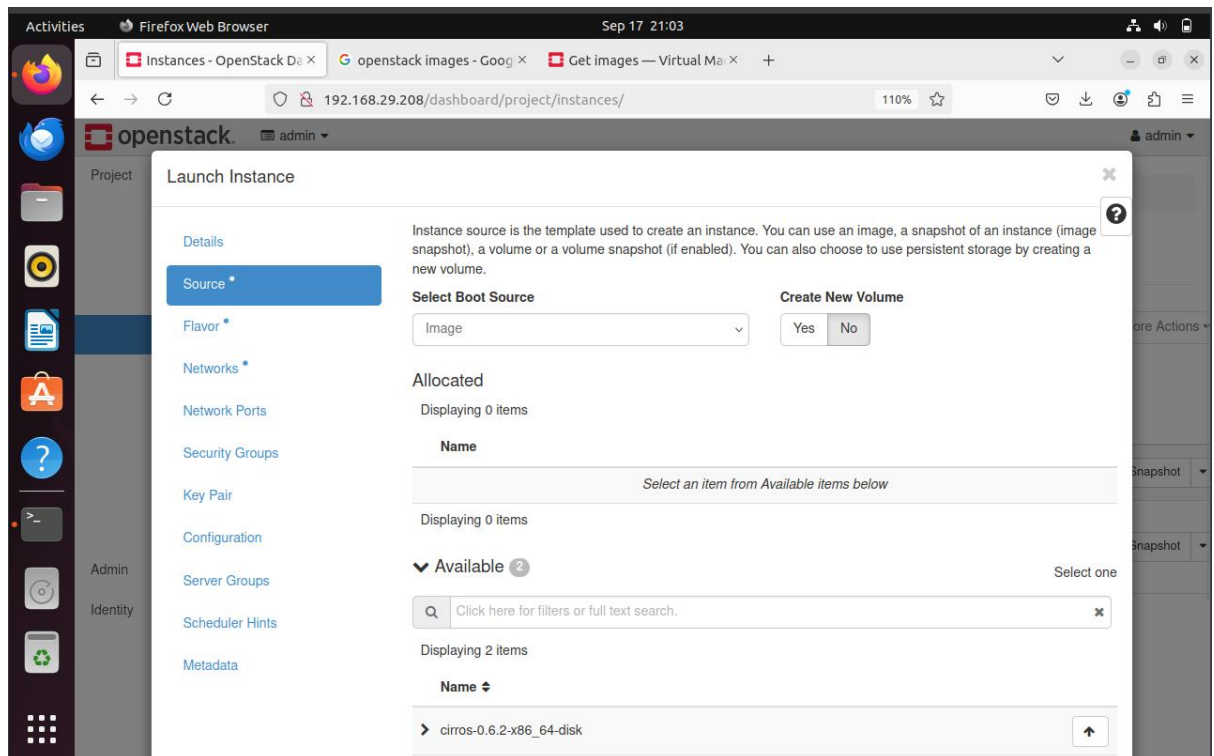

VM Setup

Step 1: Launching Virtual Machines (VMs)

Two virtual machines were successfully launched in the OpenStack environment. Both VMs were assigned to the appropriate networks as follows:

- **VM 1** was connected to the **Public Network**.
- **VM 2 named test** was connected to both the **Private-Network** and a **Floating IP** from the **Public-Network** for external access.

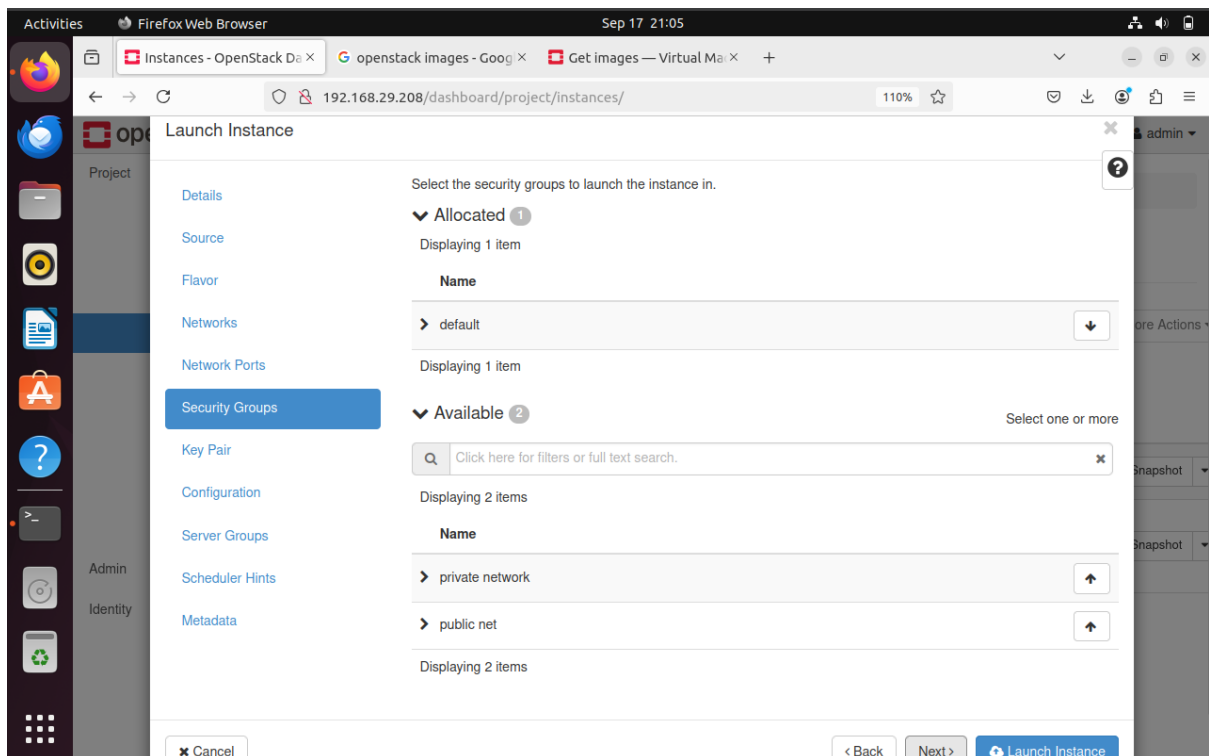

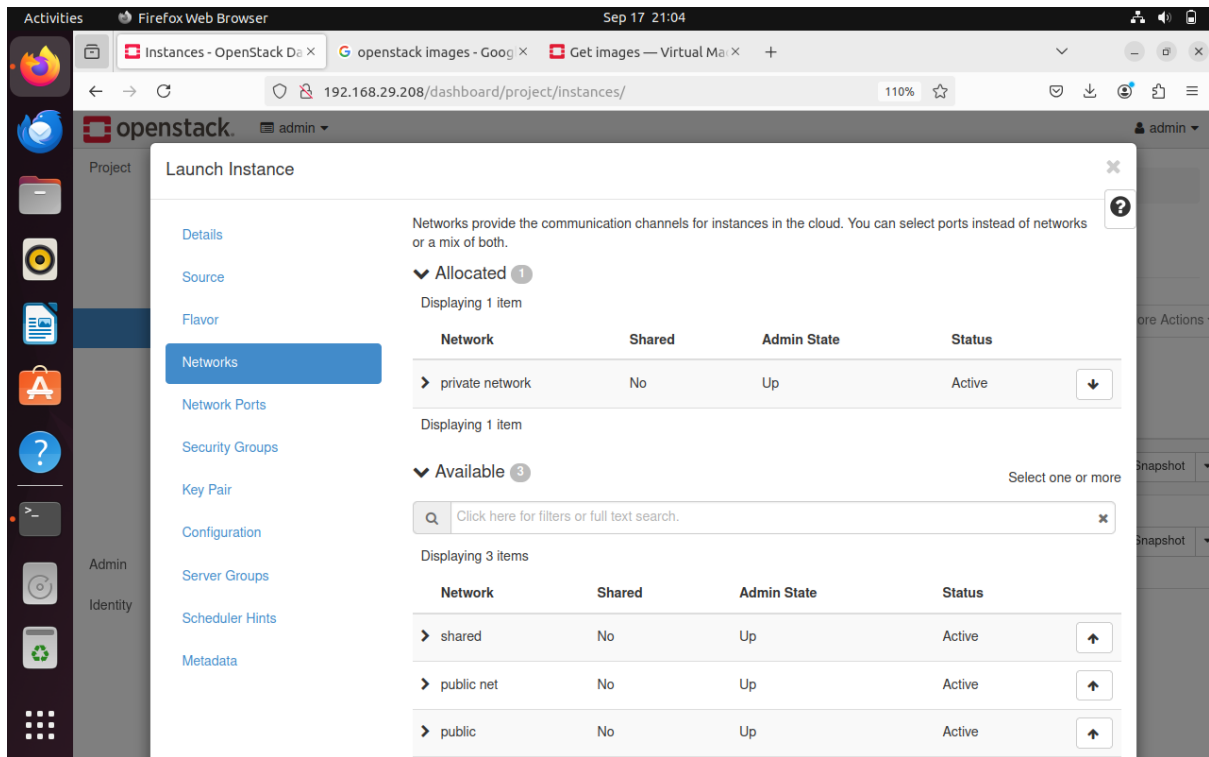

Step 2: Accessing the VMs

- **SSH Access:** Using the allocated floating IP, SSH was used to access both virtual machines. This confirmed successful external network communication.

Step 3: Testing VM Connectivity

- **VM-to-VM Connectivity:** Pinging between the two VMs within the **Private-Network** confirmed internal network functionality.
- **External Network Connectivity:** VMs connected to the public network were able to access external resources, ensuring proper configuration of floating IPs.

VM Management

Step 1: VM Operations

Several operations were performed to manage the VMs:

1. **Pause and Resume:**
 - VMs were paused to temporarily halt their processes and then successfully resumed.

Displaying 2 items

<input type="checkbox"/>	Instance Name	Image Name	IP Address	Flavor	Key Pair	Status		Availability Zone	Task	Power State	Age	Actions
<input type="checkbox"/>	public	ubuntu 22.04	172.24.4.79, 2001:db8::244	db.medium	ssh	Paused		nova	None	Paused	10 minutes	Create Snapshot
...												
<input type="checkbox"/>	Instance Name	Image Name	IP Address	Flavor	Key Pair	Status		Availability Zone	Task	Power State	Age	Actions
<input type="checkbox"/>	public	ubuntu 22.04	172.24.4.79, 2001:db8::244	db.medium	ssh	Active		nova	None	Running	11 minutes	Create Snapshot

2. **Stop and Start:**
 - Both VMs were stopped and later restarted to ensure they could be managed without data loss or connectivity issues.

<input type="checkbox"/>	Instance Name	Image Name	IP Address	Flavor	Key Pair	Status		Availability Zone	Task	Power State	Age	Actions
<input type="checkbox"/>	public	ubuntu 22.04	172.24.4.79, 2001:db8::244	db.medium	ssh	Suspended		nova	None	Shut Down	21 minutes	Create Snapshot
...												
<input type="checkbox"/>	Instance Name	Image Name	IP Address	Flavor	Key Pair	Status		Availability Zone	Task	Power State	Age	Actions
<input type="checkbox"/>	public	ubuntu 22.04	172.24.4.79, 2001:db8::244	db.medium	ssh	Active		nova	None	Running	11 minutes	Create Snapshot

3. **Delete:**
 - After testing, one of the VMs was deleted successfully from the system, demonstrating full lifecycle management.

<input type="checkbox"/>	Instance Name	Image Name	IP Address	Flavor	Key Pair	Status		Availability Zone	Task	Power State	Age	Actions
<input type="checkbox"/>	public	ubuntu 22.04	172.24.4.79, 2001:db8::244	db.medium	ssh	Suspended		nova		Shut Down	21 minutes	Update Metadata

Step 2: VM Snapshot and Auto-Scaling

- **Snapshot Creation:**
 - A snapshot of one of the VMs was taken to save its current state. The snapshot feature worked as expected, allowing the VM state to be restored later.

Create Snapshot ✕

Snapshot Name *

Description:
A snapshot is an image which preserves the disk state of a running instance.

- **Auto-Scaling** (if possible):
 - Although auto-scaling was not demonstrated due to the setup, the infrastructure supports scaling resources based on demand.

Challenges & Solutions

Challenge 1: SSH Syntax Error Due to Incorrect Key Formatting

- **Issue:** A "syntax error near unexpected token newline" occurred when trying to use SSH with an improperly formatted key.
- **Solution:** Use the correct syntax by referencing the private key file:

```
ssh -i /path/to/private_key.pem ubuntu@<ip_address>
```

```
deep@deep-VirtualBox: ~  
deep@deep-VirtualBox:~$ ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQACzYruyuavzLU8xdwQbMhuQR4MwXMwDEXeQTt+vmPfhVggyQLXwIQ32aFD3cqm07KJPFVyPFUmcQw3pG5dagX/9PbJ8z9j1TcUg8JrcS/a+23A3Le9eF99tjahI8usqu4UrwGrs7nuQ1jz+lv7DvDxxS1N/vX7V7G1fUxceC4HWx0rWEWduKqTl1ofZxLKKKju6Sw8XcaURN2jT4IDonvCedfmqWXBvk1i3MSJVNTprTaba2I9sAgNH5XgZRBa0YX/+RiW0jT48MVLmljL3ly6tn7+Z8Fck9+pVoMGLz781v4qS35JWZ4fS9GefZqm6FSR2foZM5N0Yu55vY049aZ5 Generated-by-Nova  
ssh-rsa: command not found  
deep@deep-VirtualBox:~$ ssh -i <ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQACzYruyuavzLU8xdwQbMhuQR4MwXMwDEXeQTt+vmPfhVggyQLXwIQ32aFD3cqm07KJPFVyPFUmcQw3pG5dagX/9PbJ8z9j1TcUg8JrcS/a+23A3Le9eF99tjahI8usqu4UrwGrs7nuQ1jz+lv7DvDxxS1N/vX7V7G1fUxceC4HWx0rWEWduKqTl1ofZxLKKKju6Sw8XcaURN2jT4IDonvCedfmqWXBvk1i3MSJVNTprTaba2I9sAgNH5XgZRBa0YX/+RiW0jT48MVLmljL3ly6tn7+Z8Fck9+pVoMGLz781v4qS35JWZ4fS9GefZqm6FSR2foZM5N0Yu55vY049aZ5 Generated-by-Nova> ubuntu@<10.20.20.0>  
bash: syntax error near unexpected token `newline'  
deep@deep-VirtualBox:~$ ssh -i <192.168.1.0> ubuntu@<10.20.20.0>  
bash: syntax error near unexpected token `newline'  
deep@deep-VirtualBox:~$
```

Challenge 2: VM Connectivity

- **Issue:** There was difficulty pingging between the two VMs initially.
 - **Solution:** After reviewing the security groups, the necessary ICMP rules were added to allow pingging, resolving the connectivity issue.
-

Conclusion:

This assignment provided valuable hands-on experience with OpenStack installation, configuration, and virtual machine management. Setting up networks, security groups, and floating IPs helped me understand the fundamentals of cloud infrastructure. Although there were challenges, especially with installation and networking, the solutions applied improved my problem-solving skills. Overall, this experience gave me practical knowledge of cloud environments, which will be useful in future projects.
